"Prognosis of the Wilms Tumor."

Budapest, Orvosi Hetilap, Vol 104, No 2, 15 Jan 62, pp 63-66.

Abstract: [Authors' Hungarian summary modified] Twenty cases of Wilms tumor, over a period of 10 years, are reviewed. In 17 cases, the age of patients was below four years. In most cases, the abdominal tumor called attention to the disease. Pyelography proved to be the most useful diagnostic tool. Radical surgery and post-operative irradiation is advocated. Success should not be concluded before survival for two years. Of 20 patients, only six are alive and of these three show metastasis. The authors' experience contradicts favorable prognoses of the disease, reported by others. Of 15 references, 3 are Hungarian, the rest western.

AUTHORS: Rák Kálmán, Krizsa Frerenc, Sővényi Ervin, Cserháti István (Doctors)

TITLE: The effects of ultraviolet therapy on the survival of X-ray irradiated mice

PERIODICAL: Magyar Radiologia, no.1, 1962, 48-51

TEXT: It was observed by the authors that exposure of the entire body of mice to 300 r X-rays after treatment by U.V. did not produce thrombocytopenia. After massive X-ray doses (500, 550 and 600 r), the percentage of survival was significantly greater if U.V. therapy was performed 24 or 48 hours previously, and the number of survival days in single animals was also augmented. Several data show that the thrombopoietic action of U.V. irradiation was not coupled with the same effect of the serotonin. It is very likely that ultraviolet radiation has a protective effect against X-ray injuries.

TITLE: The influence of X-ray irradiation on the function of
the ultraviolet thrombopoetic serum-factor and the
efficiency of this factor on mice

PERIODICAL: Kísérletes Orvostudomány, no.1, 1962, 86-90

TEXT: The aim of this work was to obtain better knowledge of
the role of the human thrombopoetic serum-factor by means of U.V.
thrombocytosis in mice. It was found that a humoral factor is res-
ponsible for the thrombocytosis caused by U.V. irradiation. The
influence of a dose of 300 r X-ray irradiation on the whole U.V.
thrombopoetic serum-factor and on its formation was examined in
detail. The action of the U.V. thrombopoetic serum-factor on the
number of thrombocytes in the recipient mice after X-ray treatment
was also investigated. On the basis of these results it seems
probable that the formation site of the factor responsible for

Card 1/2

The influence of X-ray irradiation ... H/018/62/000/001/001/001
I067/I267

thrombocytosis is located in the bone marrow or in the hematopoietic tissues, which are sensitive to X-ray irradiation. The factor - in vitro - shows sensitivity towards irradiation. It is highly probable that the action of the thrombopoietic factor is directed against the megakaryocyte system of the bone marrow.

"The Role of the Spleen in the Development of Mouse Thrombocytosis Caused by Ultraviolet Radiation."

Budapest, Kiserletes Orvostudomany, Vol 15, No 1, Feb 63, pp 62-65.

Abstract: [Authors' Hungarian summary] The presence of the spleen is required for the development of mouse thrombocytosis caused by UV radiation. The role of the spleen is not so much in the formation but rather in the activity of the UV factor. During the days following the UV radiation, the megacaryocytes of the spleen increase in number but this reaction subsides by the time that the peripheral thrombocytosis reaches its maximum. The thrombopoiesis of the spleen plays a presumably important role, in a specific manner, in the development of UV-induced thrombocytosis. Of 11 references, 6 are Hungarian, the rest is Western or Japanese.

"The Thrombopoetic Activity of Serum in Experimental Thrombocytosis of Mice."

Budapest, Kiserletes Orvostudomany, Vol 15, No 2, Apr 63, pp 130-133.

Abstract: [Authors' Hungarian summary] The thrombocyte count of mice rises significantly after acute blood loss. Their sera, six hours after the loss of blood, causes thrombocytosis in normal, recipient mice, lasting several days. On administration of thrombokinase, the circulating thrombocyte count drops by 50 per cent at first, then rises greatly for several days. The thrombocytosis producing factor may be demonstrated in sera 8 and 24 hours after treatment. The sera of mice which suffered blood loss or were treated with thrombokinase, when obtained 24 hours after treatment, proved to be inactive. It may be assumed, that the serum factor plays a role in the physiological thrombopoiesis which ensues after a sudden and gross stress upon the thrombocyte system. Of 12 references, 4 are Hungarian, the rest is Western.

EFFECT OF HUMAN BLOOD SERUM ON THE SURVIVAL OF X-IRRADIATED
MICE (HUNGARY)

Rak, K., F. Krizsa, E. Sovenyu, and I. Cserhati. Magyar radiologia, v. 15,
no. 2, Apr 1963, 98-101. H/021/63/015/002/001/001

White mice of both sexes weighing 20 to 25 g were subjected to total-body x-irradiation with 550 r. The animals were given injections of thrombopoietic human blood serum 48 and 24 hrs before exposure. Data obtained after a 30-day observation period showed that the serum exerted a significant protective action, increasing the life span, survival rate, and thrombocyte count [see table].

Survival rate (%)	Mean life span (days)	Thrombocyte count
Controls	13.1	59,000
Test mice	22.5	110,000

"Study of Mouse-Thrombocytosis in Response to Ultraviolet Irradiation."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 90-93.

Abstract: [Authors' Hungarian summary] Following UV irradiation, thrombocytosis of several days' duration develops in mice. An increase in the number of megakaryocytes in the spleen may be responsible for the increase in the number of thrombocytes in the circulation; the number of lienal megakaryocytes is significantly elevated on the 2nd and 3rd days after the treatment. The number of giant cells in the bone marrow remains unchanged. In the post-hemorrhagic thrombocytosis of mice, the megakaryocytes of the bone marrow are also increased in number. It is probable that the thrombocytoses developed in response to different influences are based on different mechanisms. 6 Hungarian, 8 Western references. [Manuscript received 17 Mar 66.]

"The Treatment of Sheep Mange Using Activated Creoline in the USSR."

Budapest, Magyar Állatorvosok Lapja, Vol 18, No 3, Mar 63, pp 124-125.

Abstract: [Author's English summary modified] A new method of treatment is described. Creoline, combined with the gamma isomer of hexachlorocyclohexane (HCH) is used and is described as activated creoline. The technique of activation, physical and chemical properties, effectiveness and method of application are described. The concentration of the activated creoline used in the bath changes with the quality of the wool in the treated sheep. No references.

SOURCE: Kiserletes orvostudomany, v. 17, no. 6, 1965, 577-580

TOPIC TAGS: blood, gas analysis, medical research, pulmonary disease, diagnostic medicine

ABSTRACT: The importance of blood gas analysis in the functional diagnosis of pulmonary diseases is pointed out. A gas-mixing apparatus and a technical modification of the gas determination method carried out in the Scholander apparatus are described. Finally, the field of application of various gas mixtures is summarized and the authors' experiences with them are described.

"Respiratory Function and Cardiological Studies in Patients Suffering From Pulmonary Heart Disease."

Budapest, Orvosi Hetilap, Vol 107, No 39, 25 Sep 66, pages 1835-1837.

Abstract: [Authors' Hungarian summary] Spirometric, blood gas analytical, EKG and electrokymographic studies were carried out on 37 patients suffering from cor pulmonale. The following conclusions were reached. 1) Spirometric studies do not furnish sufficient information for the classification of cor pulmonale into stages. 2) The O₂ concentration of the blood and its pCO₂ values are an accurate reflection of the clinical condition. 3) A close correlation can be demonstrated between the heart damage indicated by EKG and the clinical picture, on one hand, and the values of blood gas analysis, on the other hand. 4) Help is furnished by the wave anomalies observed with electrokymography for the recognition of chronic cor pulmonale and for the evaluation of its severity. 4 Eastern European, 10 Western references.

TITLE: Study of the thyroid function¹² in rats after destruction of the pituitary stalk

SOURCE: Kiserletes orvostudomany, v. 17, no. 6, 1965, 585-589

TOPIC TAGS: thyroid gland, biologic secretion, rat, gland

ABSTRACT:

The functional capacity of the TSH-thyroid system of rats with destroyed pituitary stalk has been studied by means of I^{131} uptake and excretion. The results indicated that thyroid function is decreased and the TSH-secreting activity of the anterior pituitary is impaired both one and 28 days after the operation. This functional disturbance is not as extensive, however, as in hypophysectomized animals. In response to cold stress, the TSH secretion of non-operated control rats increased considerably. This increase in activity was more moderate in the animals the pituitary stalk of which had been destroyed. The experiments indicate that, for an increase in TSH secretion, a suitable connection, that is, a sufficient amount of pituitary volume must be present between hypothalamus and adenohypophysis.
